

Essential Pre-Uni Chemistry B6.4

GCSE

A Level

Calculate the volume of $0.50 \text{ mol dm}^{-3} \text{ H}_2\text{SO}_4$ required to neutralize each of the following. Give your answer in cm^3 unless otherwise specified.

Part A (a)

25.0 cm^3 of $1.0 \text{ mol dm}^{-3} \text{ NaOH}$

Part B (b)

3.0 g CaCO_3

Part C (c)

1.25 g ZnCO_3

Part D (d)

4.03 kg MgO . Give your answer in dm^3 .

Part E (e)

100 cm^3 of $0.2 \text{ mol dm}^{-3} \text{ NH}_3 (\text{aq})$

Step and overall yield

A synthesis from phenol to give **G** ($\text{C}_8\text{H}_8\text{O}_2$) was carried out as shown below.

Figure 1: Three-step synthesis starting from phenol.

Part A Overall yield

47.0 g of phenol gave 44.5 g of the final product **G** ($\text{C}_8\text{H}_8\text{O}_2$). What is the overall percentage yield of **G** from phenol? Give your answer to the nearest integer.

Part B Step II yield

The yield for step I, for the conversion of phenol to **E** ($\text{C}_8\text{H}_8\text{O}_2$), was 75 %, and the yield for the hydrolysis of **F** ($\text{C}_{10}\text{H}_{10}\text{O}_3$) to **G** ($\text{C}_8\text{H}_8\text{O}_2$) in step II was 100 %. What is the percentage yield for step II? Give your answer to the nearest integer.

Essential Pre-Uni Chemistry B3.2

RTP = room temperature and pressure.

Any gas occupies 24 dm^3 per mole at RTP.

Avogadro's number, $N_A = 6.02 \times 10^{23}$.

Part A (a)

Calculate the amount of gas (at RTP) in 4.8 dm^3 .

Part B (b)

Calculate the amount of gas (at RTP) in 12 m^3 .

Part C (c)

Calculate the amount of gas (at RTP) in 400 cm^3 . Give your answer to 2 significant figures.

Part D (d)

Calculate the amount of gas (at RTP) in 18 ml .

Essential Pre-Uni Chemistry B3.1

GCSE

A Level

RTP = room temperature and pressure.

Any gas occupies 24 dm^3 per mole at RTP.

Avogadro's number, $N_A = 6.02 \times 10^{23} \text{ mol}^{-1}$.

Part A (a)

Calculate the volume occupied by 4.0 moles of gas at RTP.

Part B (b)

Calculate the volume occupied by 0.030 moles of gas at RTP.

Part C (c)

Calculate the volume occupied by 5.0×10^{18} atoms of helium gas at RTP.

Part D (d)

Calculate the volume occupied by 1.2×10^{24} molecules of ozone at RTP.

Part E (e)

Calculate the volume occupied by 8.0 g of O_2 at RTP.

Part F (f)

Calculate the volume occupied by 1.1 kg of carbon dioxide at RTP.

Oxidation Yield

Oxidation of phenylethene (12.0 g, C_8H_8) gave benzoic acid ($\text{C}_7\text{H}_6\text{O}_2$), which needed 100 cm^3 of 1.00 mol dm^{-3} aqueous NaOH for neutralisation. The benzoic acid only has one acidic group and so reacts with the hydroxide in a 1 : 1 molar ratio.

Calculate the percentage yield of benzoic acid from phenylethene in this reaction rounding to the nearest integer.

Essential Pre-Uni Chemistry B3.4

GCSE

A Level

RTP = room temperature and pressure.

Any gas occupies 24 dm^3 per mole at RTP.

Avogadro's number, $N_A = 6.02 \times 10^{23}$.

Part A (a)

Calculate the number of **atoms** (at RTP) in 60 cm^3 of argon.

Part B (b)

Calculate the number of **atoms** (at RTP) in 1.2 dm^3 of N_2 .

Part C (c)

Calculate the number of **atoms** (at RTP) in 8.0 m^3 of carbon dioxide.

Part D (d)

Calculate the number of **atoms** (at RTP) in 420 cm^3 of ethene. Give your answer to 2 significant figures.

Essential Pre-Uni Chemistry B3.5

GCSE

A Level

RTP = room temperature and pressure.

Any gas occupies 24 dm^3 per mole at RTP.

Avogadro's number, $N_A = 6.02 \times 10^{23}$.

Part A (a)

Calculate the the mass of 1.0 m^3 of neon at RTP.

Part B (b)

Calculate the the mass of 20 cm^3 of $(\text{CH}_3)_2\text{O}$ at RTP.

Part C (c)

Calculate the the mass of 420 cm^3 of ammonia at RTP. Give your answer to 2 significant figures.

Yield vs Atom Economy

Identify the correct statements about percentage yield and atom economy.

1. Both percentage yield and atom economy can theoretically range from 0 % to 100 %.
2. The percentage yield of a reaction is always less than or equal to its atom economy.
3. The atom economy of a reaction will always be increased by adding a catalyst.

Smelting

A Level - Practice (P1)

Smelting of metal ores is often carried out with carbon monoxide. The metal ore is reduced by the carbon monoxide gas, which is itself oxidised to carbon dioxide (a waste product) in the process.

Consider the above occurring for the reduction of CuO and Fe_2O_3 to the respective metals: copper and iron. Calculate the atom economy for each of these two reactions, giving your answer as a percentage rounded to the nearest integer.

Part A CuO

Calculate the atom economy for the reduction of CuO .

Part B Fe_2O_3

Calculate the atom economy for the reduction of Fe_2O_3 .

Alcohol Oxidation Efficiency

A Level - Practice (P1)

A student was given the following instructions for the preparation and identification of a carbonyl compound:

To 100 cm³ of water in a flask, carefully add 30 cm³ of concentrated sulfuric acid and set up the apparatus for distillation.

Make up a solution containing 28.0 g of sodium dichromate(VI), Na₂Cr₂O₇ in 15.0 cm³ of water; add 18.0 g of the alcohol, C₃H₈O, and pour the solution into a dropping funnel connected to the flask.

Boil the acid in the flask. Add the mixture containing the alcohol at such a rate that the product is collected slowly.

Re-distil the crude product and collect the fraction that boils between 48 °C and 50 °C.

The balanced equation for the process taking place is shown below:

The student obtained 7.20 g of the carbonyl compound, C₃H₆O.

Part A Atom economy

Calculate the atom economy for this process, treating only the carbonyl compound as a useful product. Give your answer expressed as a percentage and rounded to the nearest integer.

Part B Moles of dichromate

Calculate how many moles of Na₂Cr₂O₇ were used.

Part C Limiting reagent

Identify which reagent was limiting and fill in its molecular formula. Assume that concentrated sulfuric acid has a concentration of 18.4 mol dm⁻³.

Part D Percentage yield

Calculate the percentage yield obtained by the student. Give your answer rounded to the nearest integer.
